EXPERIMENT 6

Roll NO:240701448 Name: Sabitha.R

RAD (Rapid Application Development) is a software development methodology that emphasizes quick development and iteration of prototypes over strict planning and long development cycles. It's ideal for projects where requirements evolve through user feedback and where fast delivery is important.

Key Characteristics of RAD:

- Focus on prototypes instead of extensive documentation
- User involvement throughout the development process
- Fast development cycles with frequent iterations
- Reusable components to reduce effort
- Best suited for UI/UX-intensive projects like web and mobile apps

Phase 1: Requirements Planning

This is where the project goals, system requirements, and user needs are identified. Stakeholders, users, and designers collaborate to decide what needs to be built.

1) Identify Key Features

Navigation:

- Login
- Home
- Food Categories
- Cart
- Checkout
- Order Confirmation
- Profile

User Actions: Browsing, Searching, Adding to Cart, Checkout, Tracking Orders

2) Create a Requirements Document:

1. View login screen and authenticate user
2. View list of food categories
3. View food items under each category
4. View detailed information about a food item
5. Add items to cart and view cart
6. Checkout and enter delivery/payment details
7. View order confirmation message
8. View and edit user profile

Phase 2: User Design

Designers and users collaborate to create wireframes and prototypes. The idea is to show how the application will look and behave before any actual coding starts.

1) Tools Used: Axure RP: Used to design the wireframes and UI prototype.

2) Wireframes Designed:

- **Login Page:** Allows user to login with username and password
- **Home Page:** Highlights featured food items and search bar
- **Product Categories:** Lists all food categories to explore
- **Cart:** Shows added items with price and quantity details
- **Checkout:** Collects delivery address and payment information
- **Order Confirmation:** Confirms successful order placement
- **Profile:** Shows user details and settings

Designed interactions and navigation using Axure's Prototype mode Reused components like headers/footers using Components Annotated elements for clarity (e.g., what a button does, purpose of sections)

Phase 3: Construction

This is where the actual development happens, but in RAD, it is tightly coupled with ongoing testing and feedback. You refine the prototype based on user responses.

1) Interactive Prototypes:

- Created using Axure's prototype linking features
- Functional paths designed:
  - Login → Home → Categories → Product Details → Cart → Checkout → Order Confirmation
  - Home → Profile

2) Dynamic Elements:

- Simulated transitions for adding to cart and checking out
- Screens simulate real-time behavior such as navigating between food listings and cart

3) Testing and Iteration:

- Prototype previewed with Preview mode in Axure
- Collected feedback from stakeholders
- Iterated based on visual hierarchy, accessibility, and flow suggestions

Phase 4: Cutover

In this final phase, the system goes live. This includes finalizing the design, training users, and preparing documentation for developers.

1) Finalization and Export:

- Final design prototype tested through Axure Preview
- Ready for hand-off to development team
- Can be exported to HTML/CSS if needed

2) User Training & Support:

- Walkthrough of the prototype for stakeholders
- Notes/documentation provided for developers to understand functionality and user flow
- Easy access to Axure comments for further collaboration and questions
